

adjustments are applied instantaneously ("live") where possible (until we have this functionality, an "apply" button will be necessary, and will switch to "restart and apply" as needed

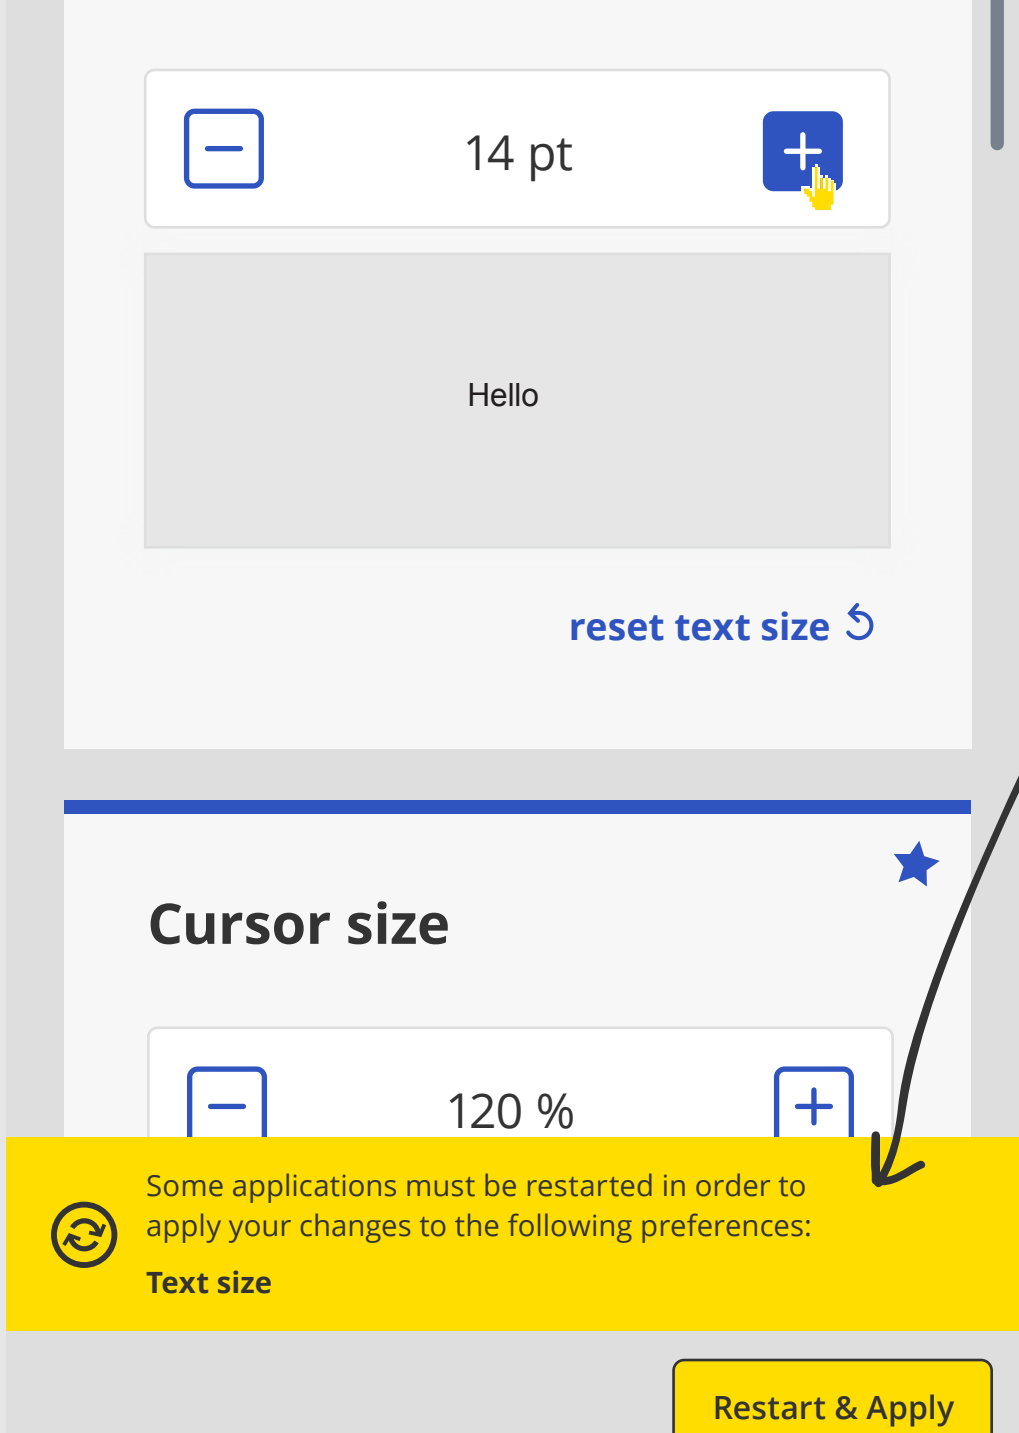

preferences requiring a restart are flagged with restart icon

hover - tool tip

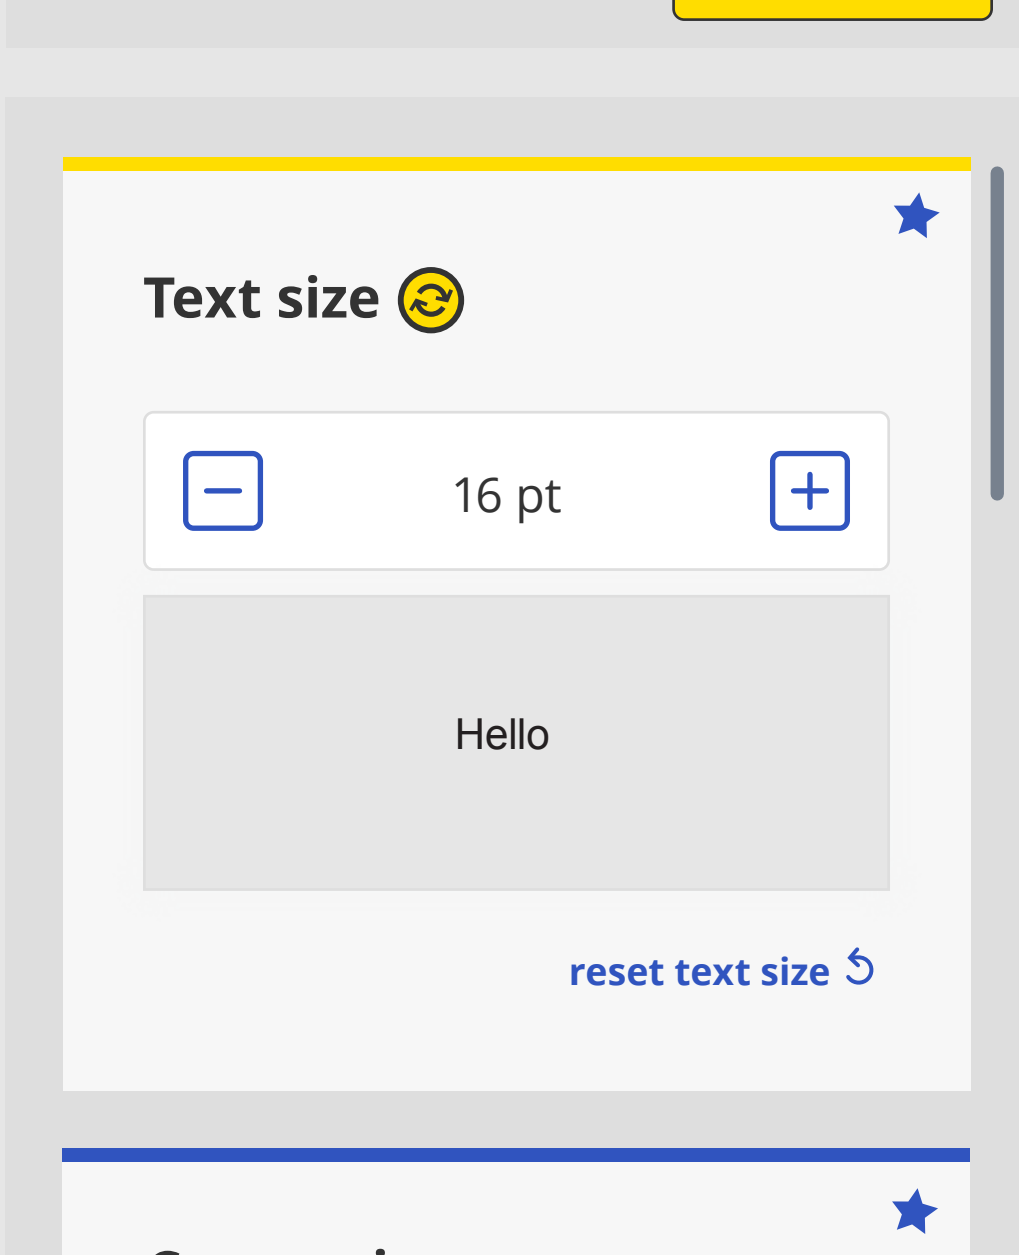

★ hover state (when favoured) and un-favourited state in PMT

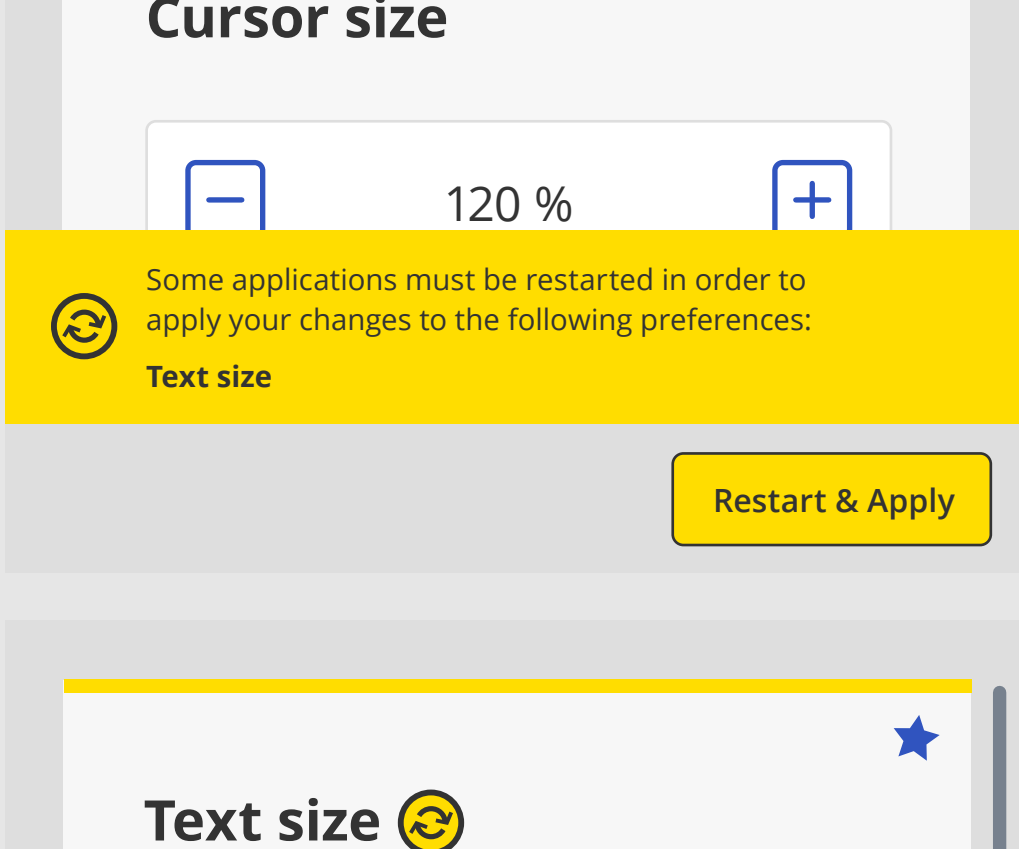

Remove text size from my quick preferences panel

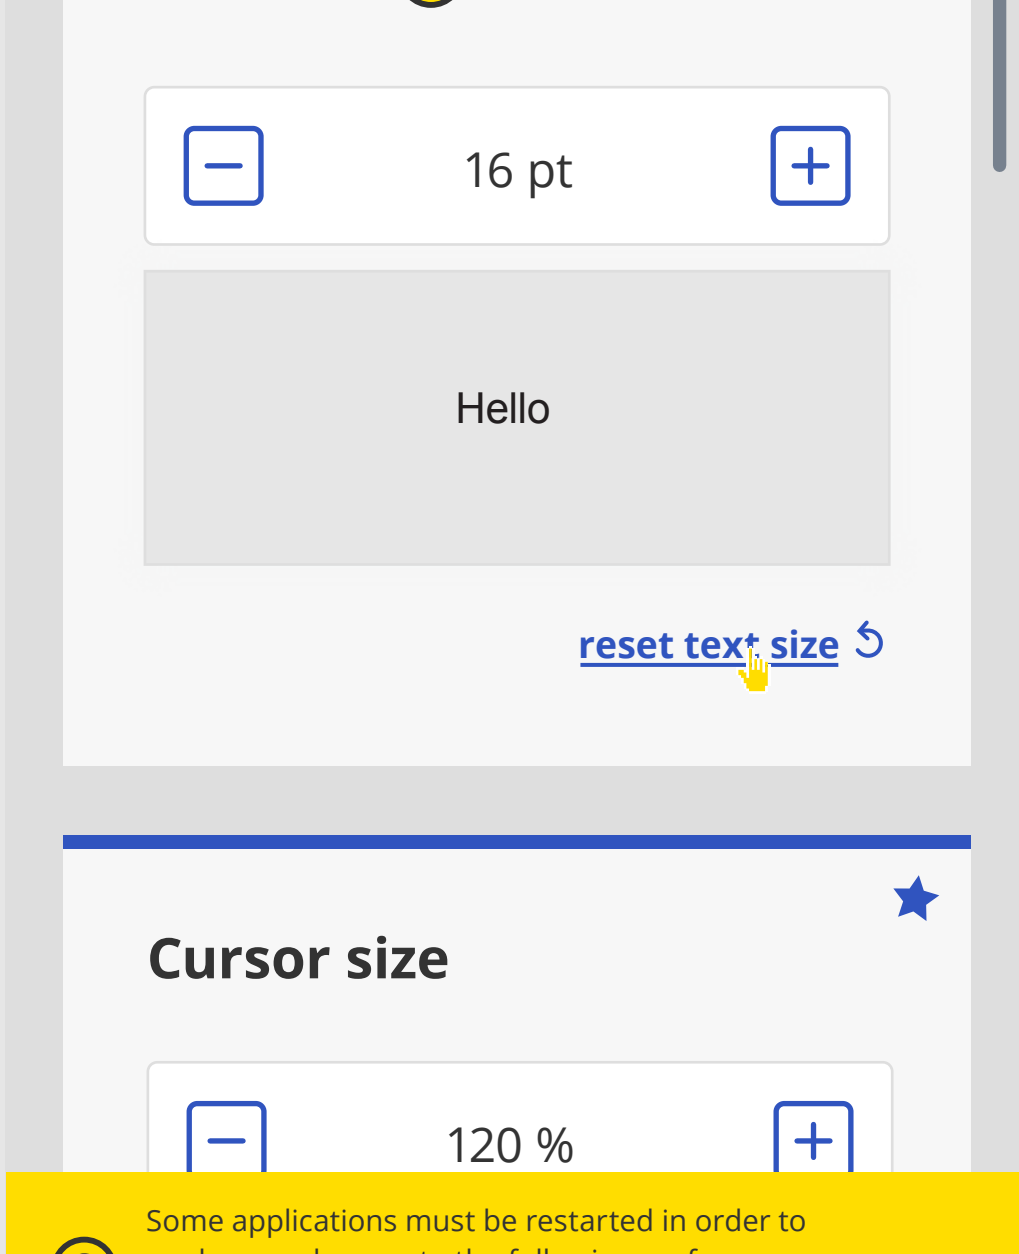

Preferences can be removed from PCP at any time

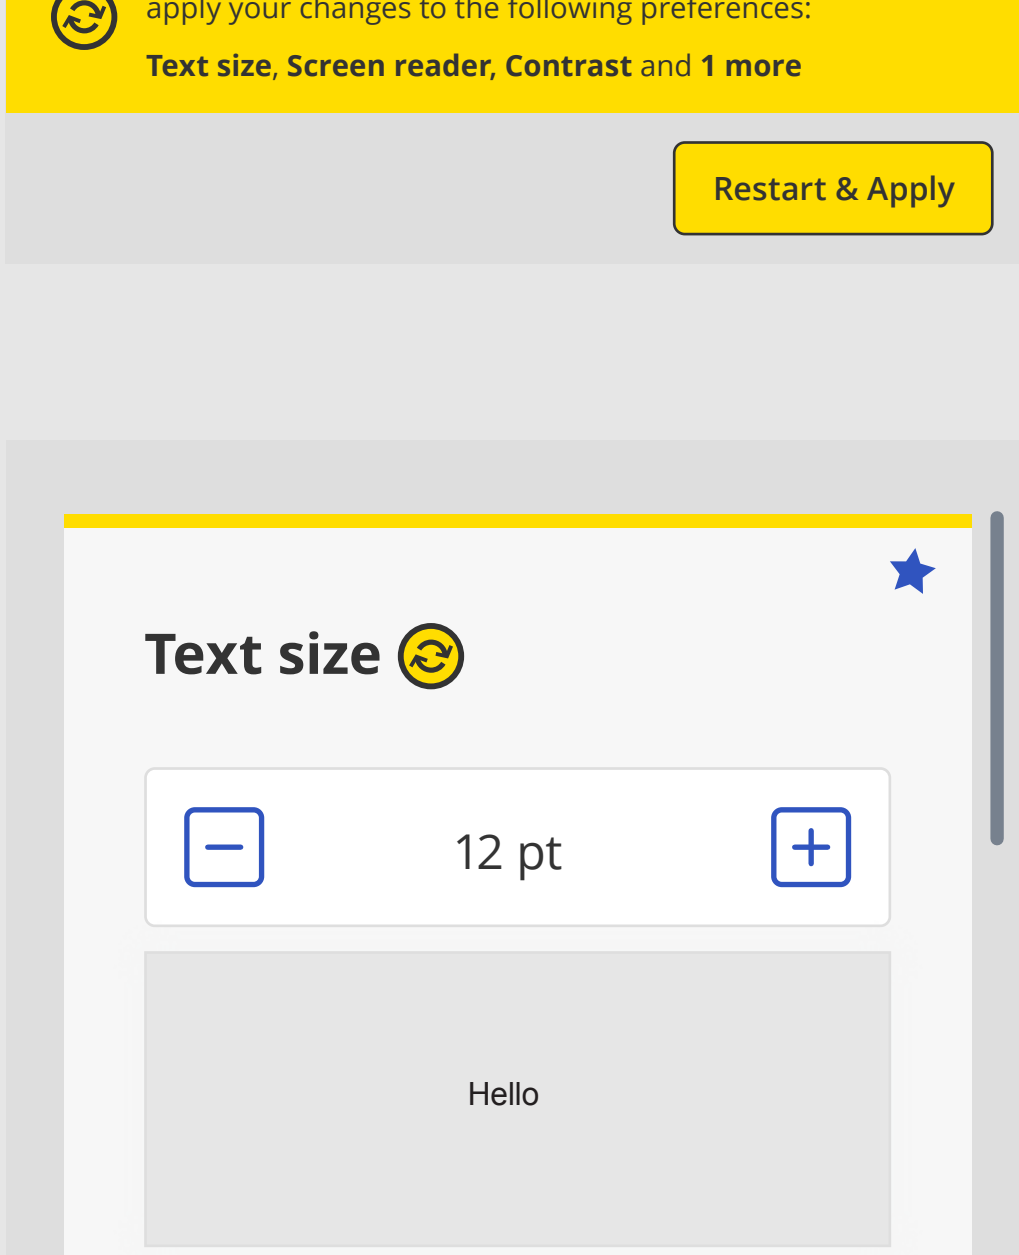

adjustment made / in progress - yellow bar appears at the top (where restart is not needed, blue bar appears instead) - notification appears at bottom of PCP

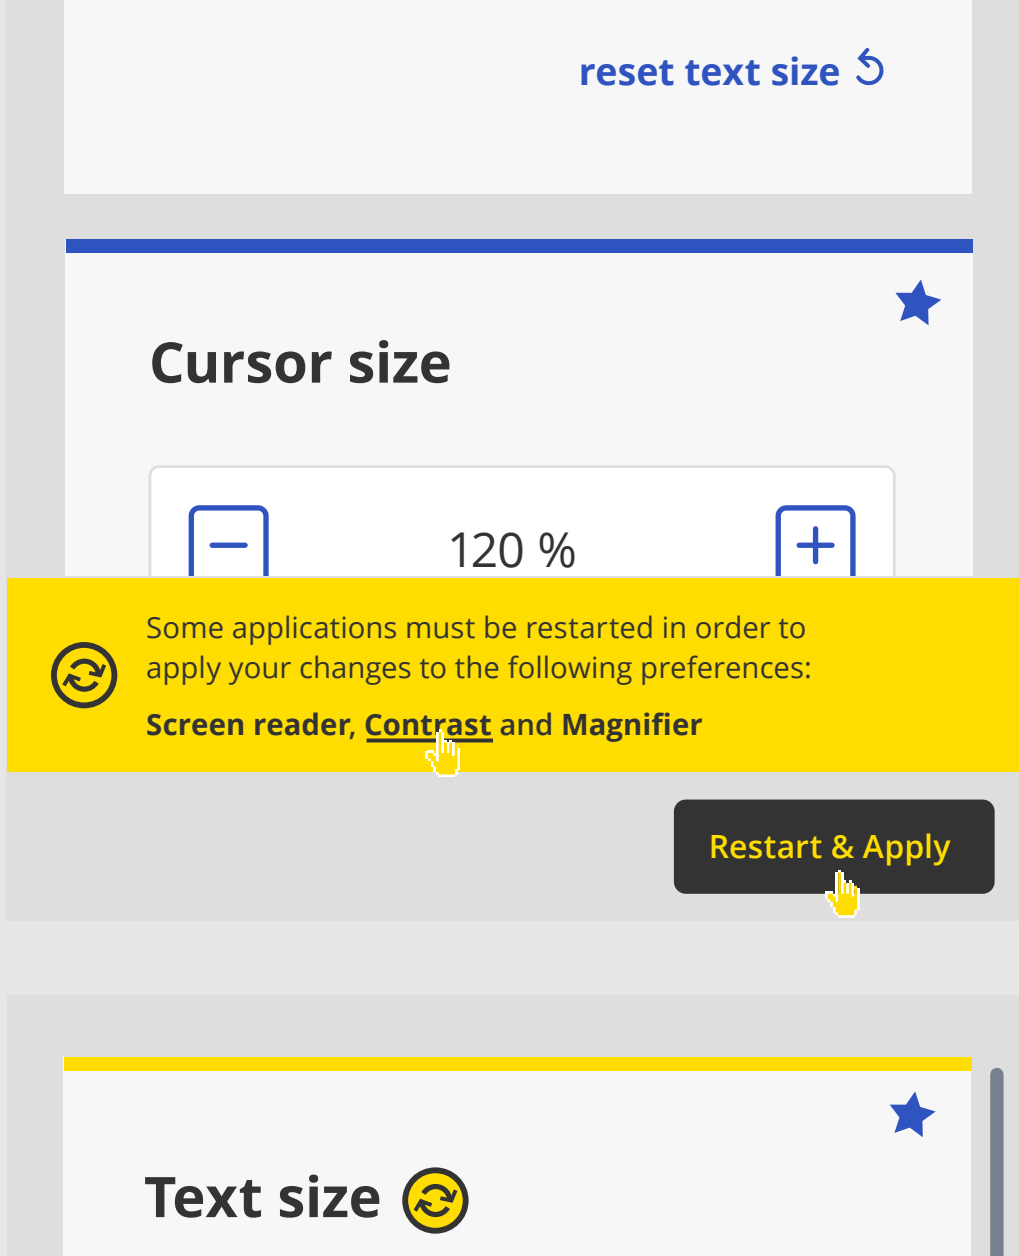

notification window and restart & apply button appears when an adjustment requiring a restart is made

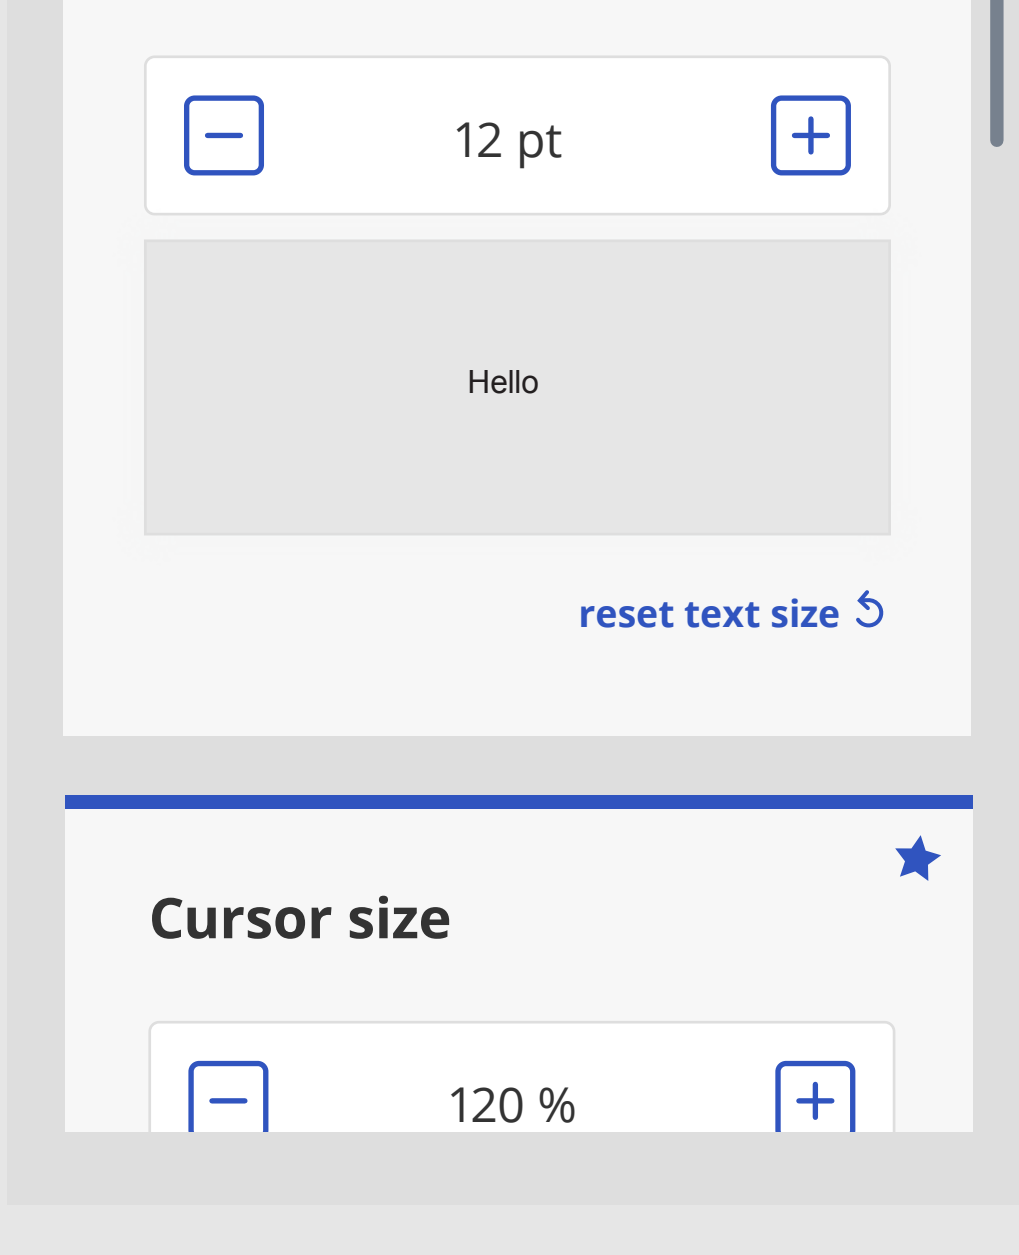

adjustment made

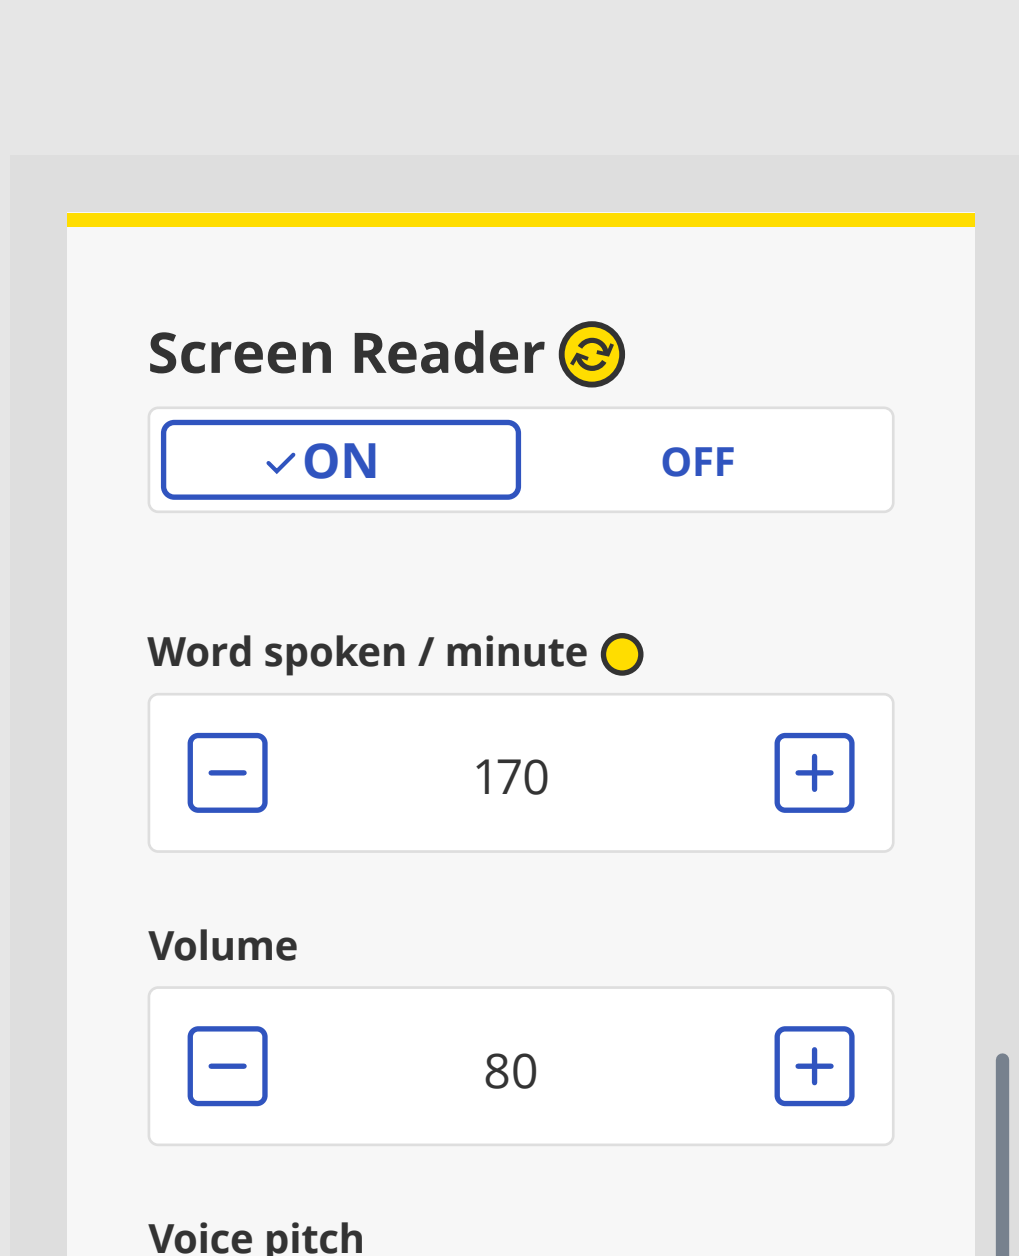

notifications remains until save & apply is selected, or adjuster is reset to default

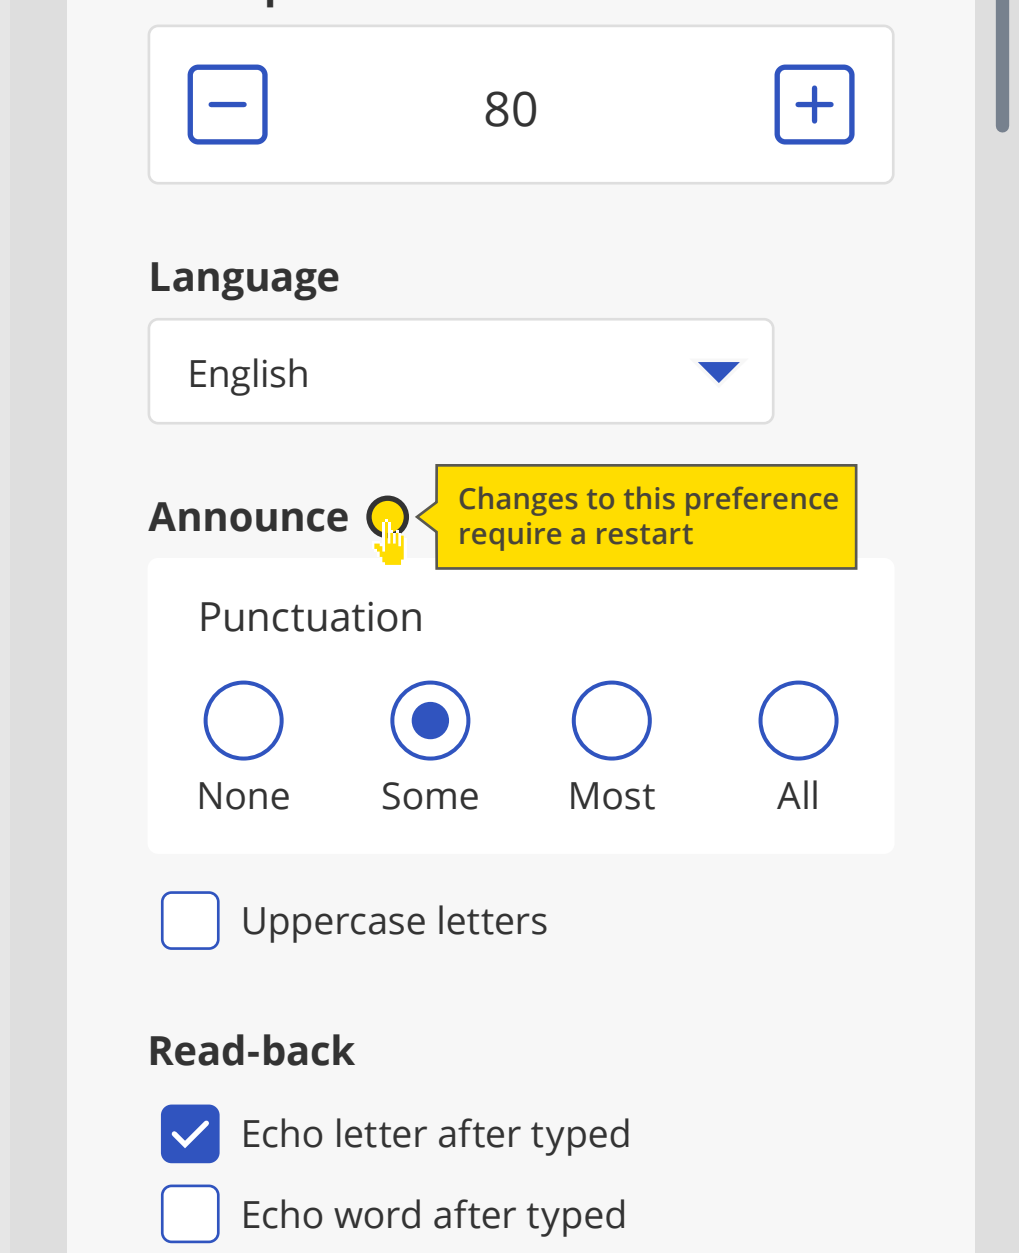

further adjustments are made to other preferences...

all preference adjustments requiring reset are listed at the bottom of the panel - user can select these and be taken to the preference

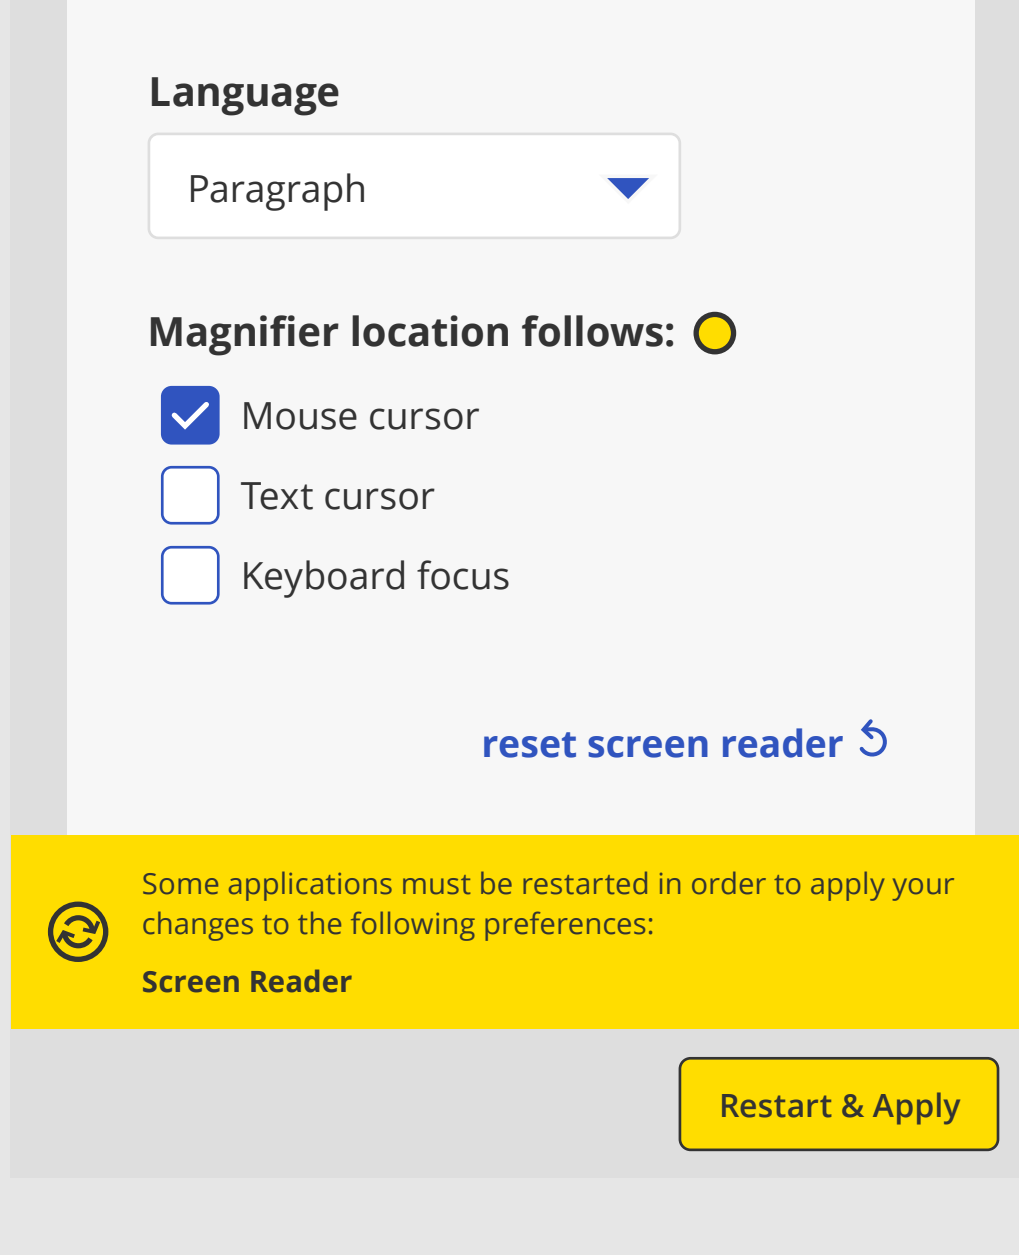

text size has been reset to default, relevant notification is removed from list at bottom, restart icon remains

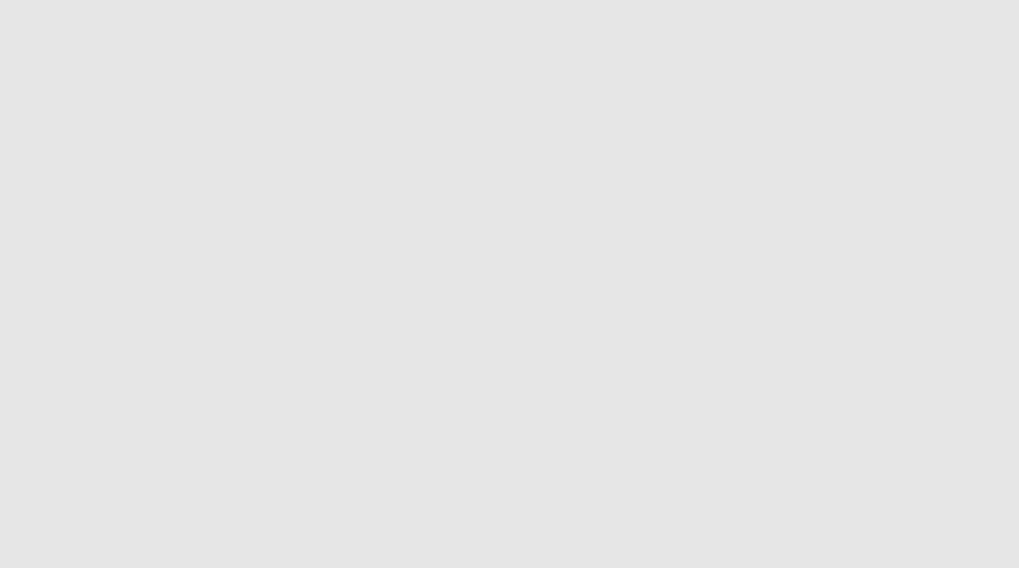

all preference adjustments requiring reset are listed at the bottom of the panel

selecting preference from list takes user to that preference panel

user selects restart and apply, all applications have been restarted and all preferences applied (notification disappears from bottom of panel)

if user makes adjustments to prefs requiring a restart, but does not select restart & apply, they will be returned to the tool in the same state as they left it (i.e. with unapplied changes) [alternatively changes can be applied automatically the next time they log into device, but this could be confusing as user may not remember the changes they made in the last session. if they decided not to apply them the first time they likely don't want them applied automatically the next time]

For clarity and brevity, the restart notifications will list only the preference family (e.g. 'Screen Reader'), rather than individual adjusters (e.g. 'Volume' or 'Language'). For users' reference, small circles indicate which adjusters have been changed within the preference family.
